AMENDMENTS TO THE CLAIMS

1. (Original) An edge correcting circuit of an image to be represented by a digitized image signal, comprising:

a high-frequency signal extracting circuit for extracting a high-frequency signal of the image by calculation based on a signal of a pixel which is to be corrected (hereinafter called a target pixel), a signal of a pixel shifted from the target pixel by m (m being an integer not smaller than 2) pixels in the right or lower direction, and a signal of a pixel shifted from the target pixel by m pixels in the left or upper direction;

an amplitude-restricting signal generator for determining an amplitude-restricting signal based on a minimum value or a maximum value of an absolute value of a difference between the signal of the target pixel and a signal of a pixel shifted from the target pixel by n (n being an integer not smaller than 1 and smaller than m) pixels in the right or lower direction, and an absolute value of a difference between the signal of the target pixel and a signal of a pixel shifted from the target pixel by n pixels in the left or upper direction;

an amplitude restricting circuit for restricting the output of the high-frequency extracting circuit so that the absolute value of the output of the high-frequency extracting circuit is not more than the output of the amplitude-restricting signal generator; and an adder for adding the output of the amplitude restricting circuit or a signal obtained therefrom, as an edge correction signal, to the signal of the target pixel.

- 2. (Original) The edge correcting circuit as set forth in claim 1, wherein said high-frequency extracting circuit has the function of altering the amplitude of the high-frequency signal output therefrom.
- 3. (Original) The edge correcting circuit as set forth in claim 1, wherein said amplitude-restricting signal generator has the function of altering the amplitude of the amplitude-restricting signal output therefrom.
- 4. (Original) The edge correcting circuit as set forth in claim 1, further comprising:
- a subtractor for subtracting the output of the amplitude restricting circuit from the output of the high-frequency extracting circuit;

an amplitude control circuit for controlling the amplitude of the output of the subtractor; and

a second adder for adding the output of the amplitude control circuit and the output of the amplitude restricting circuit;

wherein the output of the second adder is used as the edge correction signal.

5. (Original) The edge correcting circuit as set forth in claim 1, further comprising:

a subtractor for subtracting the output of the amplitude restricting circuit from the output of the high-frequency extracting circuit;

an amplitude adjusting circuit for adjusting the amplitude of the output of the amplitude restricting circuit; and

a second adder for adding the output of the subtractor and the output of the amplitude adjusting circuit;

wherein the output of the second adder is used as said edge correction signal.

6. (Original) An edge correcting circuit of an image to be represented by a digitized image signal, comprising:

a high-frequency signal extracting circuit for extracting a high-frequency signal of the image by calculation based on a signal of a pixel which is to be corrected (hereinafter called a target pixel), a signal of a pixel shifted from the target pixel by m (m being an integer not smaller than 2) pixels in the right or lower direction, and a signal of a pixel shifted from the target pixel by m pixels in the left or upper direction;

an amplitude-restricting signal generator for determining an amplitude-restricting signal based on a difference between the signal of the target pixel and a signal of a pixel shifted from the

target pixel by n (n being an integer not smaller than 1 and smaller than m) pixels in the right or lower direction, and a difference between the signal of the target pixel and a signal of a pixel shifted from the target pixel by n pixels in the left or upper direction;

an amplitude restricting circuit for restricting the output of the high-frequency extracting circuit so that the absolute value of the output of the high-frequency extracting circuit is not more than the output of the amplitude-restricting signal generator; and

an adder for adding the output of the amplitude restricting circuit or a signal obtained therefrom, as an edge correction signal, to the signal of the target pixel;

wherein

said amplitude-restricting signal generator outputs "0" when a first difference value obtained by subtracting the signal of the target pixel from the signal of the pixel shifted by n pixels from the target pixel in the right or lower direction, and a second difference value obtained by subtracting the signal of the target pixel from the signal of the pixel shifted by n pixels from the target pixel in the left or upper direction are of the same sign (or at least one of them is zero), and

said amplitude-restricting signal generator selectively outputs that one of the first and second difference values which is of the same sign as the output of the high-frequency extracting circuit,

when neither of the first and second difference values is zero, and the first and second difference values have different signs.

- 7. (Original) The edge correcting circuit as set forth in claim 6, wherein said high-frequency extracting circuit has the function of altering the amplitude of the high-frequency signal output therefrom.
- 8. (Original) The edge correcting circuit as set forth in claim 6, wherein said amplitude-restricting signal generator has the function of altering the amplitude of the amplitude-restricting signal output therefrom.
- 9. (Original) The edge correcting circuit as set forth in claim 6, further comprising:

a subtractor for subtracting the output of the amplitude restricting circuit from the output of the high-frequency extracting circuit;

an amplitude control circuit for controlling the amplitude of the output of the subtractor; and

a second adder for adding the output of the amplitude control circuit and the output of the amplitude restricting circuit;

wherein the output of the second adder is used as the edge correction signal.

10. (Original) The edge correcting circuit as set forth in claim 6, further comprising:

a subtractor for subtracting the output of the amplitude restricting circuit from the output of the high-frequency extracting circuit;

an amplitude adjusting circuit for adjusting the amplitude of the output of the amplitude restricting circuit; and

a second adder for adding the output of the subtractor and the output of the amplitude adjusting circuit;

wherein the output of the second adder is used as said edge correction signal.

11. (New) An apparatus for correcting an edge of an image, comprising:

a first circuit to generate a high-frequency signal, the high-frequency signal being generated from an input signal, representing an image, of a target pixel, and at least two time-shifted versions of said input signal including a one time-shifted version having at least a two-pixel shift in a first direction to the target pixel and the other time-shifted version having at least a two-pixel shift in an alternative direction;

a second circuit to generate a signal to restrict amplitude, the signal being generated from the input signal of the target pixel, and at least one further time-shifted version of said input signal including a further time-shifted version having at least a

one-pixel shift from the target pixel and less than the at least two-pixel shifted versions being input to the first circuit;

a third circuit to generate an output signal from the high-frequency signal and the signal to restrict amplitude, the output signal having a maximum amplitude substantially limited to amplitude of the signal to restrict amplitude; and

an adder to add the output signal and the input signal of the target pixel to generate a modified signal of the target pixel to correct an edge of said image.

12. (New) The apparatus of claim 11, further comprising:

at least a fourth circuit to generate an output signal to be input to said adder, from the output signal generated by the third circuit, to maintain at least a portion of overshoot in the modified signal of the target pixel to correct the edge of the image.

- 13. (New) The apparatus of claim 11, wherein at least two of said first, second, and third circuits are a single circuit.
- 14. (New) A method for correcting an edge of an image, comprising:

 generating a high-frequency signal from an input signal,
 representing an image, of a target pixel, and at least two timeshifted versions of said input signal including one time-shifted
 version having at least a two-pixel shift in a first direction to

the target pixel and the other time-shifted version having at least a two-pixel shift in an alternative direction;

generating a signal to restrict amplitude from the input signal of the target pixel, and at least one further time-shifted version of said input signal including a further time-shifted version having at least a one-pixel shift from the target pixel and less than the at least two-pixel shifted versions;

generating an output signal from the high-frequency signal and the signal to restrict amplitude, the output signal having a maximum amplitude substantially limited to amplitude of the signal to restrict amplitude; and

adding the output signal and the input signal of the target pixel to generate a modified signal of the target pixel to correct an edge of said image.

15. (New) The method of claim 14, further comprising:

generating another output signal, from the output signal generated by the high-frequency signal, to maintain at least a portion of overshoot in the modified signal of the target pixel to correct the edge of the image.
